MULTIMEDIA PRODUCTION APPLIANCES

Telepresent

Getting your message out does not need to be a complex and resource-consuming task!

Telepresentation allows you to simply and effectively deliver your message to large audiences and NCast has the tools you need to do the job.

The Telepresenter M3 is an all-in-one multimedia production appliance that dramatically simplifies the business of professional content creation. Whether you are a CEO delivering a quarterly update, a teacher delivering lectures to distant students on the internet, or a manufacturer creating training tools for your customers, the Telepresenter will make your job easier. The Telepresenter will:

Capture your messages – Connect a Camera, a PC, a DVD, or virtually any other digital device to the Telepresenter and capture Videos, PowerPoint slides, audio, theme music, Copyright strings – virtually anything you need to make useful content. Effortlessly setup, schedule, start, and stop presentations with Google Calendar.

Compose your content – The Telepresenter allows you to arrange your media elements in any way you see fit through a simple web interface. You don't need an A/V team to do it. Compose using pre-defined banners, transparent static graphics, Closed Caption bars and much more.

Record and Webcast – The Telepresenter's high-performance streaming server will stream your live presentation to your audience using either unicast or multicast technology. Play it back with your favorite software Media Player or stream to a Telepresenter MD-1 connected to a flat panel, projector or digital sign. You can even push a copy of your presentation to other servers for on-demand viewing. In combination with the NCast N-Way server, you can telepresent to thousands.

Collaborate – Two or more Telepresenter users can interactively collaborate, like a Video Conferencing system, but with full graphics. Share Radiology images with colleagues, a hymnal with your congregation, or discuss a repair procedure with your field service staff.

The Telepresenter™ M3 series 2 is a WUXGA (1920x1200) Multimedia Capture and Production Appliance. It combines high definition video, high fidelity audio, and high-resolution graphics, in a fully synchronized PIP (Picture in Picture) format, into a single media stream.

Designed for maximum ease-of-use, the M3 will capture multiple video, audio, and graphical inputs and compose them into a single synchronized MPEG-4 stream using custom or predefined layouts. It will cast that stream onto local networks or the internet, archive it to local storage for on-demand playback, and collaborate with other Telepresenter users, affording fully interactive presentations.

Setting up a Telepresenter™ M3 is as simple as attaching feeds such as a HiDef Camera, a Presentation PC, a Microphone and/or a DVD player, connecting it to the network, and starting a session through a simple web interface. Of course, the Telepresenter also offers advanced customizations giving you simplicity with robust control.

N-Way Server - a versatile adjunct to Telepresenter users, an N-Way server delivers advanced network functionality and media-on-demand to organizations that use them.

An ideal 'on-demand' content server, the N-Way serves up archived files created by Telepresenter users through typical Media Players.

Additionally, The N-Way server facilitates Telepresentations by allowing large audiences to participate. By creating a tunnel for multicast traffic from Telepresenter users, the N-Way

server can cast out to large user populations, delivering all the benefits of a multicast network even when used on unicast networks.

Lastly, the N-Way server has a collaboration mode, allowing it to act as a multimedia conferencing bridge, rapidly connecting 'N' number of users together for conferencing applications.
